

Components

Even now, Fedegari is still unique among manufacturers in continuing to manufacture in-house all the most critical components; the principle that in-depth knowledge of the details is what allows the improvement of the overall design is confirmed, valid and up-to-date. One aspect that is often underestimated during component selection is the total cost of maintenance.

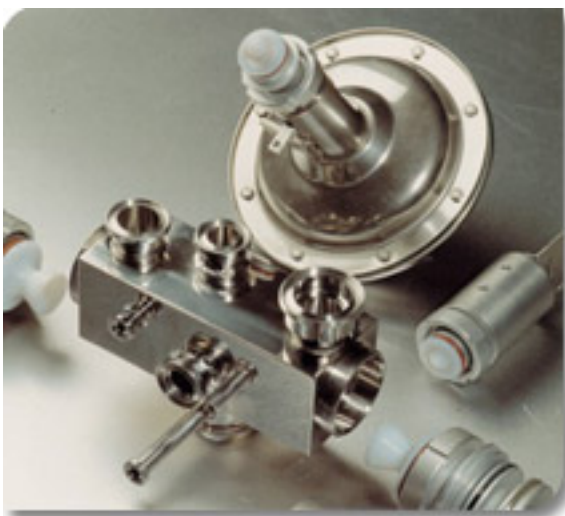

This is the sum of the cost of spare parts, time required for their replacement and training of the assigned personnel.

These factors are increasingly neglected in the overall evaluation of a machine or plant but are rising all the time due to the ever-increasing complexity of these machines or plants.

In addition to the already mentioned pressure vessels, Fedegari manufactures in-house the sanitary flanges, the sanitary valves, the manifolds, the magnetic couplings for fan rotation and for turning the internal loads as well as the various lubrication-free rolling systems and particular pumps and compressors.

More and more often, these components are sold to other companies, which use them in plants which are different but deal with the same problems as plants manufactured by Fedegari. This is a further confirmation of the validity of Fedegari's solutions also from an economic standpoint.

Moreover, these components are often imitated by other manufacturers, proving their inherent value.
